RESEARCH INTERESTS

My research focuses on deciphering the complexities of flow and reactive transport in subsurface hydrological and biogeochemical processes. I integrate field observations, laboratory experiments, and remote sensing data with numerical modeling and high-performance computing to quantify the movement of heat, nutrients, and biogeochemical reactions in porous media. Currently, I am investigating the intricate flow and transport dynamics in the supra-permafrost zone of the Arctic - a critical region that influences the stability of 50% of the world's soil carbon.
